## **Interview Questions**

**15m**

**1. Explain Python functions?**

**Answer:** A function is a section of the program or a block of code that is written once and can be executed whenever required in the program. A function is a block of self-contained statements which has a valid name, parameters list, and body. Functions make programming more functional and modular to perform modular tasks. Python provides several built-in functions to complete tasks and also allows a user to create new functions as well.

**There are two types of functions:**

- **Built-In Functions:** copy(), len(), count() are the some built-in functions.
- **User-defined Functions:** Functions which are defined by a user known as user-defined functions.

**2. What are local variables and global variables in Python?**

**Answer:**

- **Global Variables:**

**Variables declared outside a function or in global space are called global variables. These variables can be accessed by any function in the program.**

- **Local Variables:**

**Any variable declared inside a function is known as a local variable. This variable is present in the local space and not in the global space.**

**When you try to access the local variable outside the function, it will give an error.**

**3. What is Linux?**

**Answer:** Linux is an operating system based on UNIX and was first introduced by Linus Torvalds. It is based on the Linux Kernel and can run on different hardware platforms manufactured by Intel, MIPS, HP, IBM, SPARC, and Motorola. Another popular element in Linux is its mascot, a penguin figure named Tux.
